WILLS'S CIGARETTES

Early Reflecting Telescope.

Telescopes were being made in considerable numbers in Holland about 1610, and were much improved by Galileo, Kepler, and other scientists. The one shown is Sir Isaac Newton's (1642-1727). It is a reflecting telescope, the image being viewed through a compound eye-piece (A), placed at the side. It magnified from 50 to 800 times, according to the size of the parabolic mirror at B. The mounting is of the "Equatorial" type.
